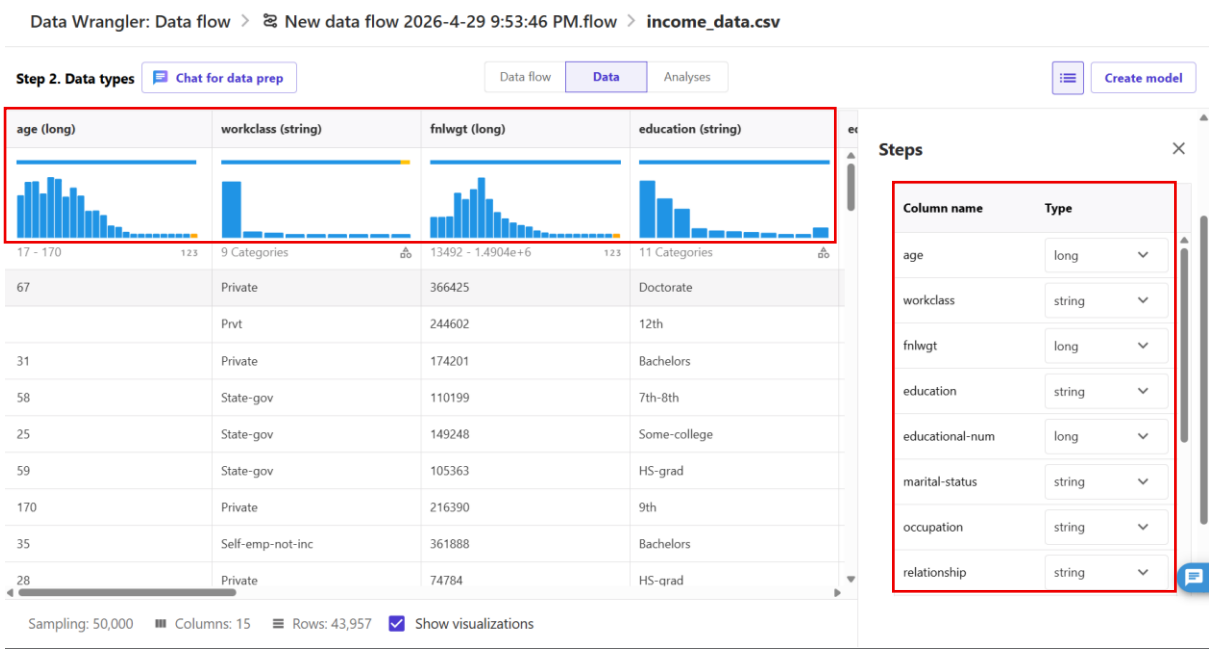
Data Wrangler - Get Insights

To Begin with the Lab

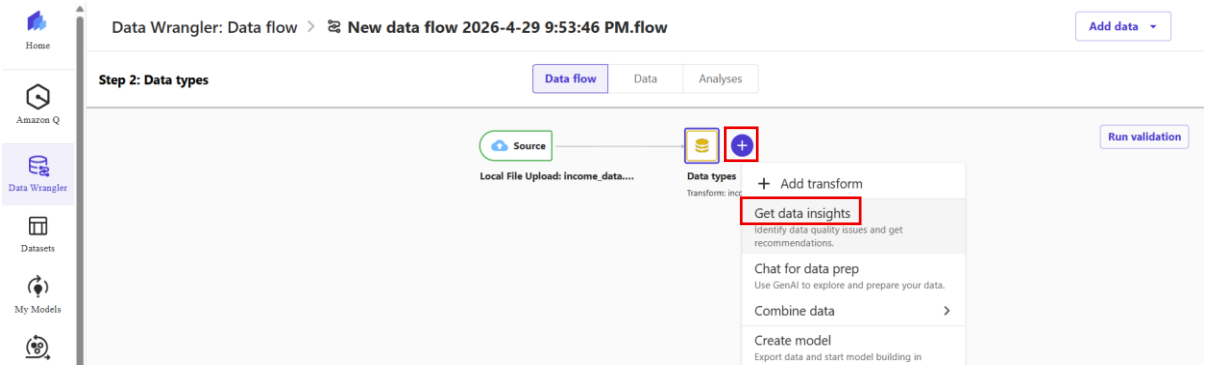
Summary of the Lab

In this lab, Data Wrangler is used to inspect datasets through summaries, charts, and histograms to detect missing values, outliers, and invalid categories. Using Get Data Insights, a Feature Correlation report is created with income as the target column to analyze relationships between variables and support better data understanding.

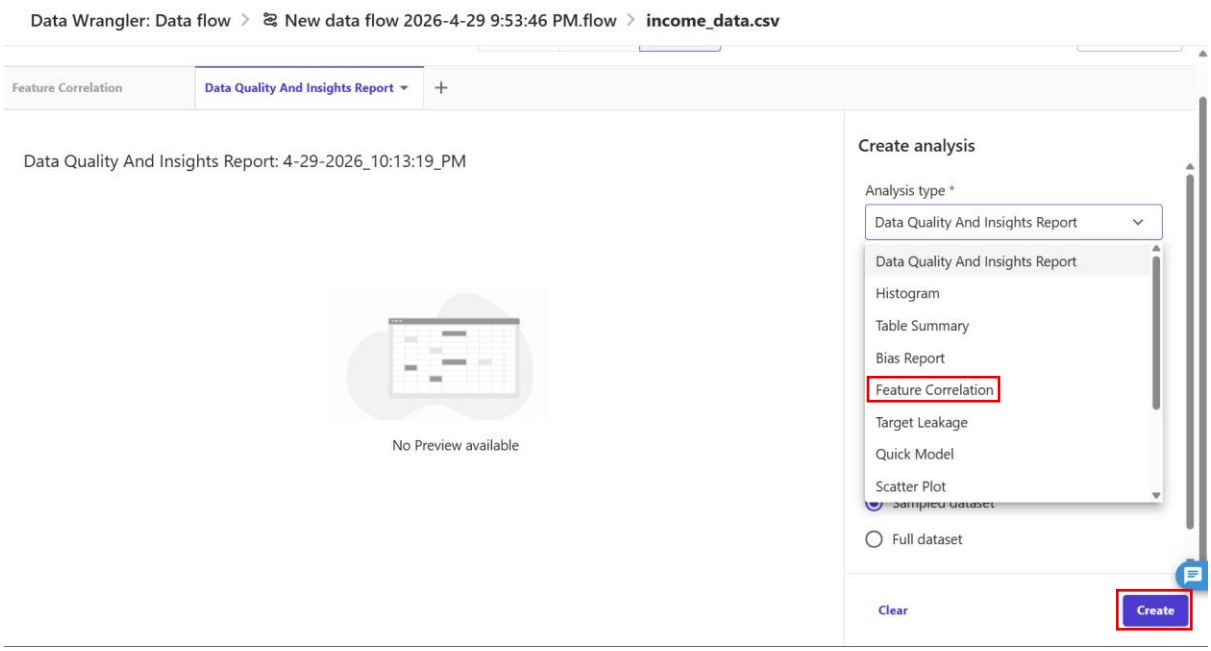
- Inspect the dataset overview by reviewing column names, data types, row values, summary charts, and histograms to identify issues like missing values, outliers, invalid categories, and age anomalies.
- Use histograms for distribution analysis to detect frequency patterns such as common workclass values (e.g., Private), rare/inconsistent categories, or unusually high age values.

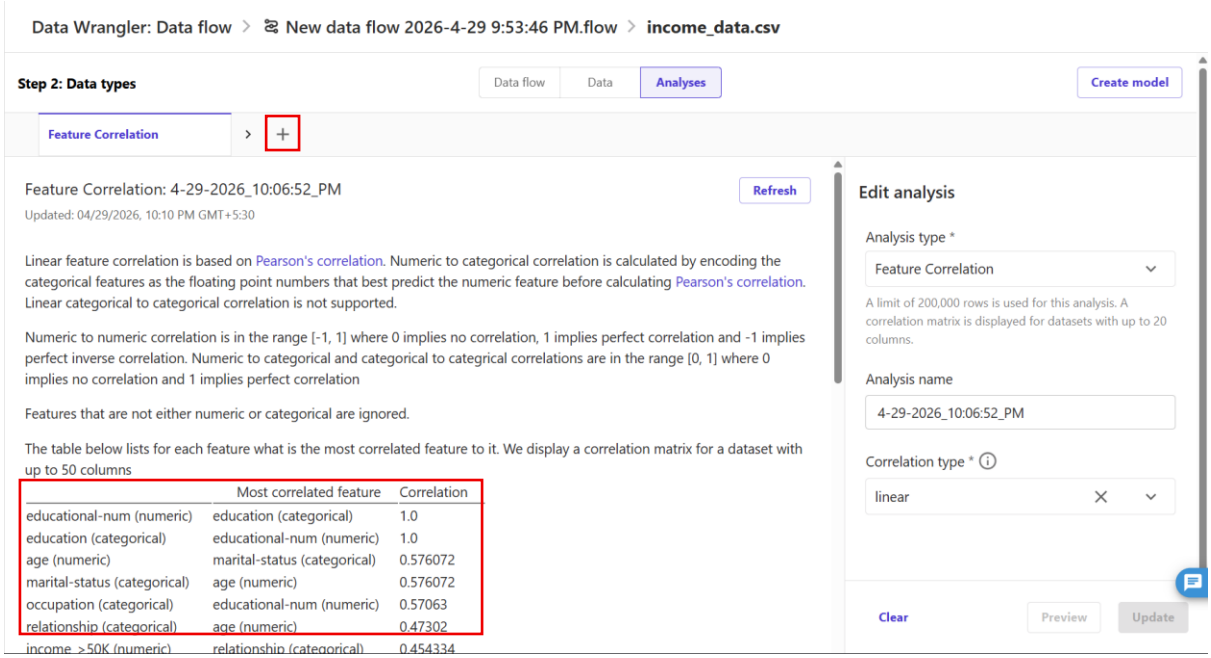


- In the data flow panel, click + Add Step
- Choose Get Data Insights



- Navigate to Analysis section.
- Available options may include:
- Feature correlation





- Create Correlation Report
- Select Feature Correlation
- Set target column:
- income
- Choose correlation type (default is acceptable)
- Click Create
- Also, you can click on the plus button and make more analysis.
