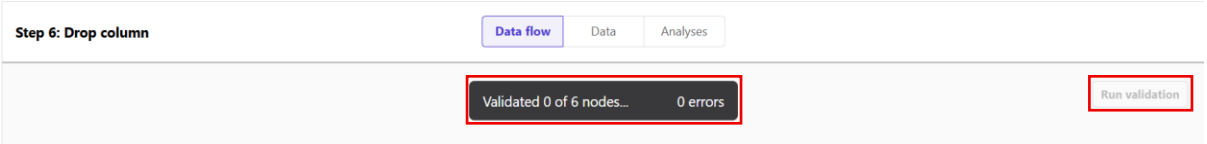
Export Data in Data Wrangler

To Begin with the Lab

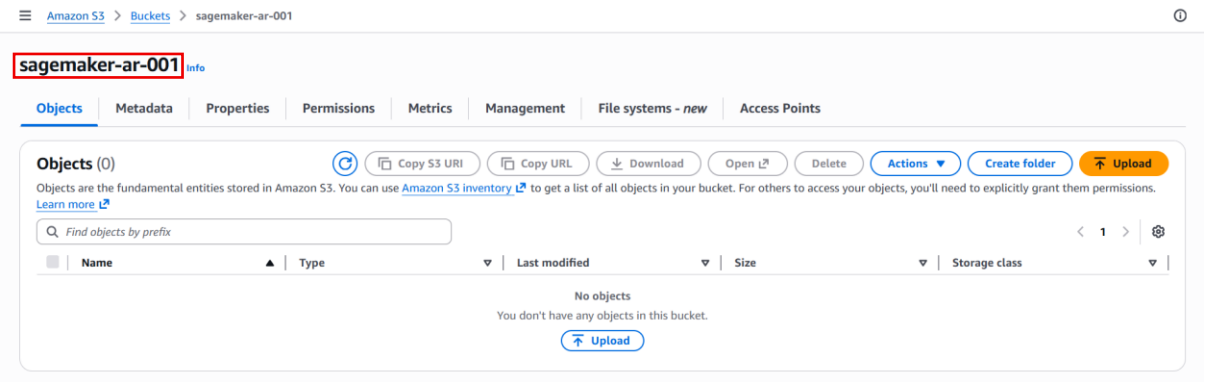
Summary of the Lab

This lab walks through exporting data from Data Wrangler to Amazon S3. First, validate the data flow to ensure no errors. Then create an S3 bucket and add export steps, including exporting via a Jupyter Notebook. After running the export, the system generates a data flow file and a notebook file in S3. Finally, download the notebook and stop the Canvas workspace instance, confirming it transitions from running to stopped.

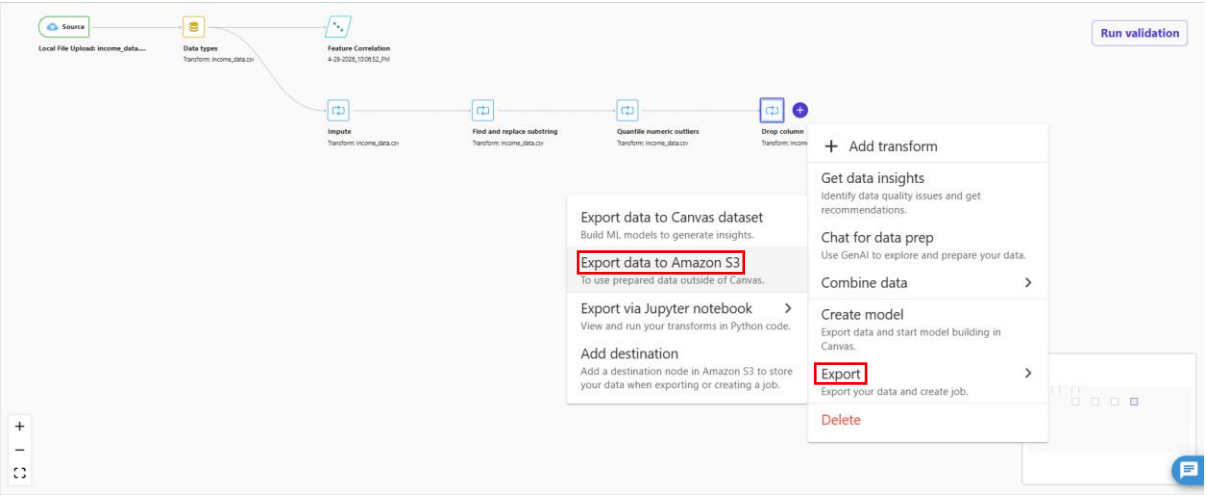
- Open your data flow in Data Wrangler.
- Click Run Validation.
- Expected Result:
    - 0 errors displayed



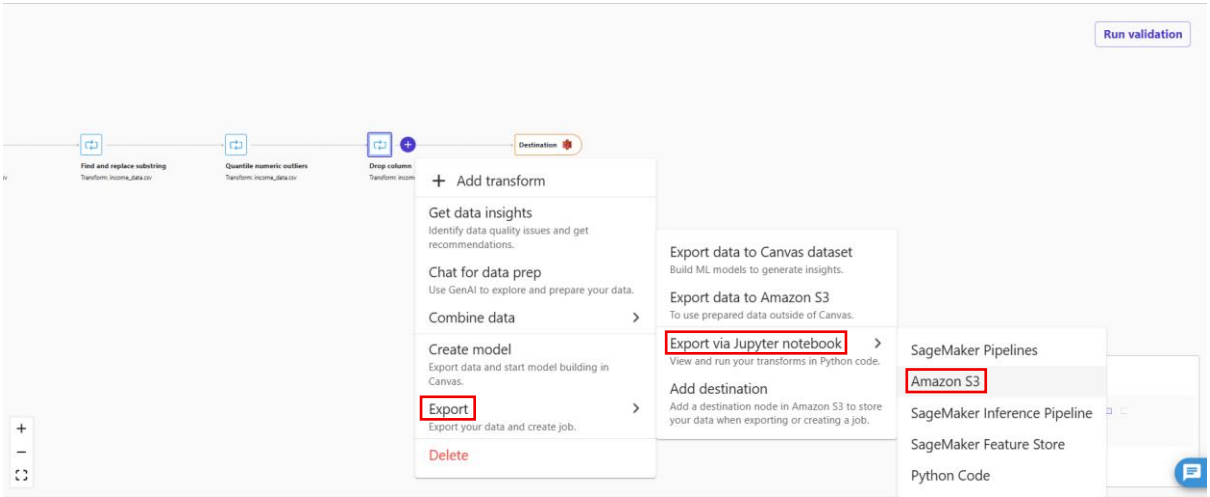
- So, we need a bucket to export the data.
- Open Amazon S3.
- Click Create bucket.
- Provide:
- Unique bucket name
- Keep default settings.
- Click Create bucket



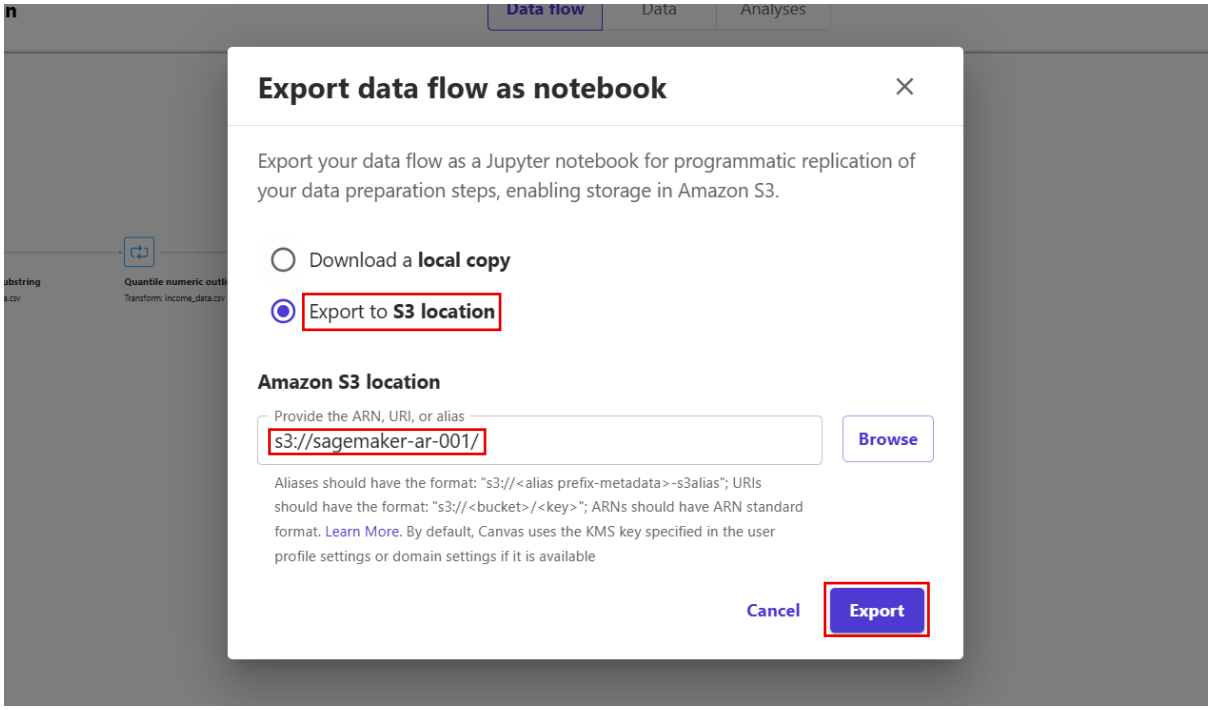
- Add Export Step
- Click + Add Step
- Select Export
- Amazon S3
- Select:
- Export to Amazon S3



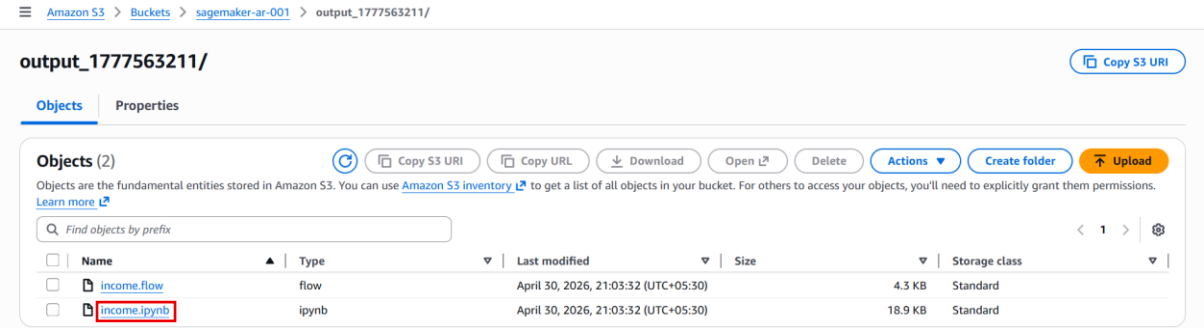
- Add New Export Step
- In data flow, click + Add Step
- Select Export via Jupyter Notebook

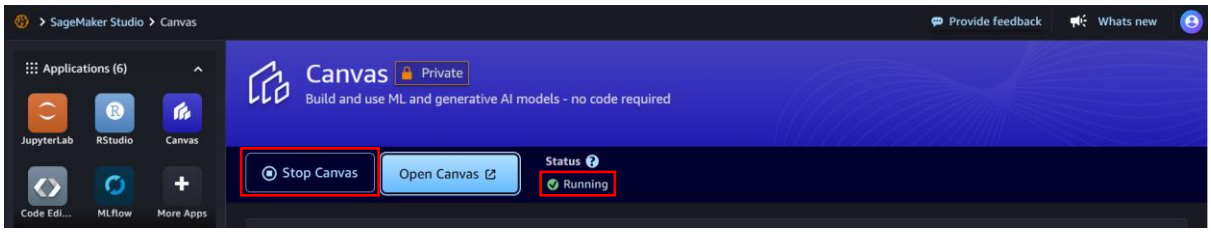


- Choose destination:
- Amazon S3
- Select same or different bucket
- Click Apply
- Click Export



- Expected Result:
- Files generated in S3:
- Data flow file
- .ipynb notebook file



- Step 11: Download Notebook
- Open S3 bucket
- Download .ipynb file


- Find Canvas workspace instance.
- Click Stop.
- Confirm stopping the workspace.
- Expected Result:
- Workspace instance begins shutting down
- Status changes from Running → Stopped
