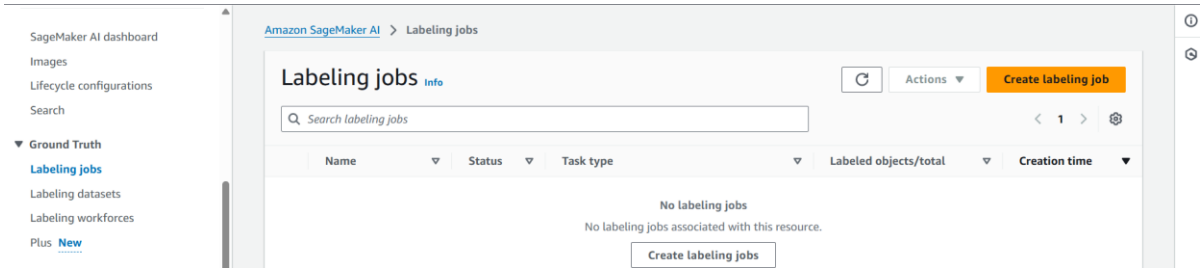
Create Labelling Jobs in Ground Truth

To Begin the with Lab

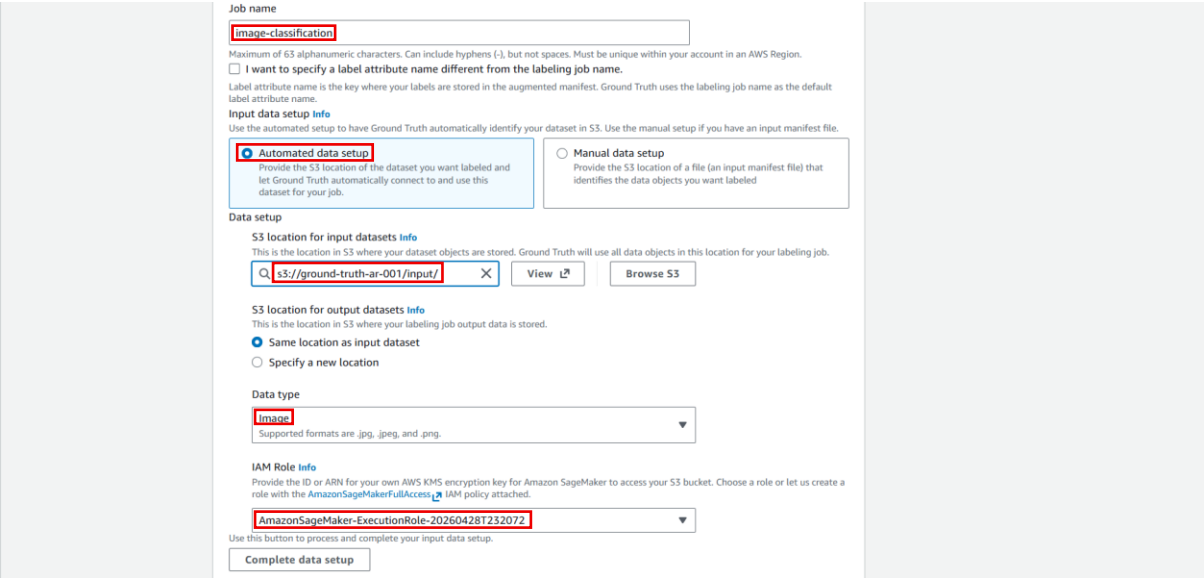
Summary of the Lab

Create an S3 bucket with **input/** for images and **output/** for results. In **Amazon SageMaker Studio**, go to Ground Truth and create a labelling job with automated data setup, linking S3 input/output and assigning an IAM role with S3 access. Choose image classification, define clear labelling instructions, and launch the job. Workers label images via the portal until complete. Finally, check the S3 output folder for labelled data and the manifest file, which can be used for training machine learning models.

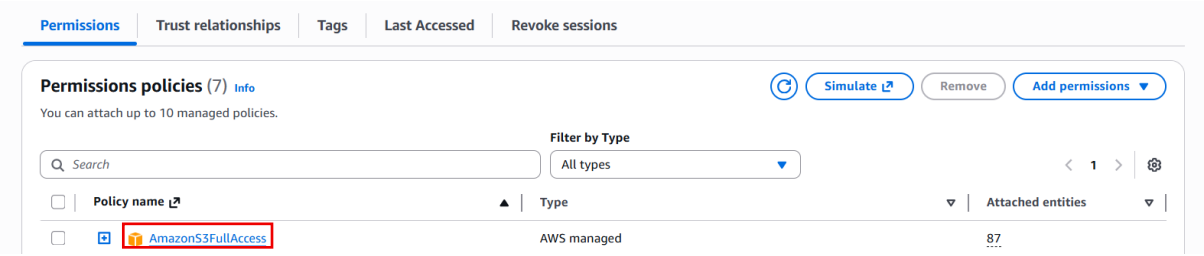
- Go Back to your S3 bucket that you have created.
    - Organize files:
    - Create folder: input/
    - Move all images into input/
    - Create folder: output/ (for results)
- Go to Amazon SageMaker Studio
- Navigate to Ground Truth → Labeling Jobs
- Click Create labeling job



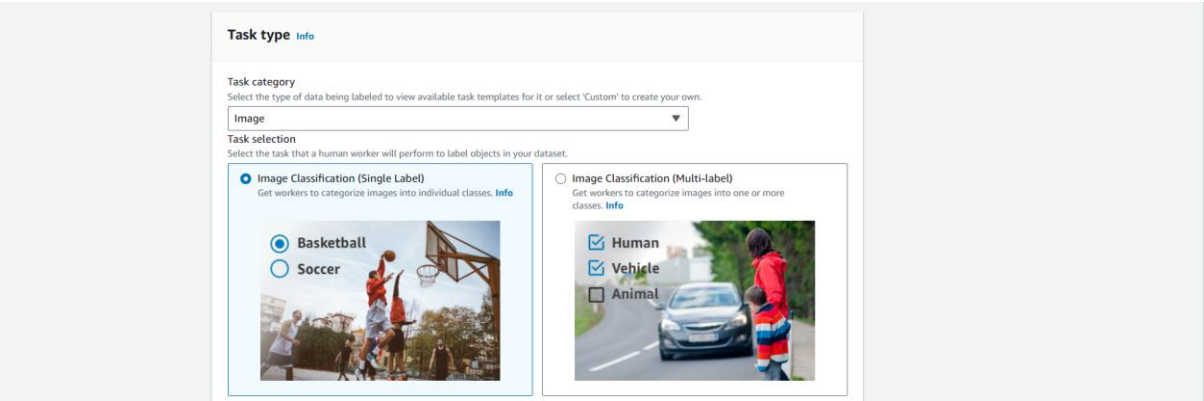
- Configure Job Details
- Job name (e.g., image-classification)
- Input data setup
- Choose Automated Data Setup
- Select S3 input (input/)
- Select S3 output (output/)
- Choose execution role



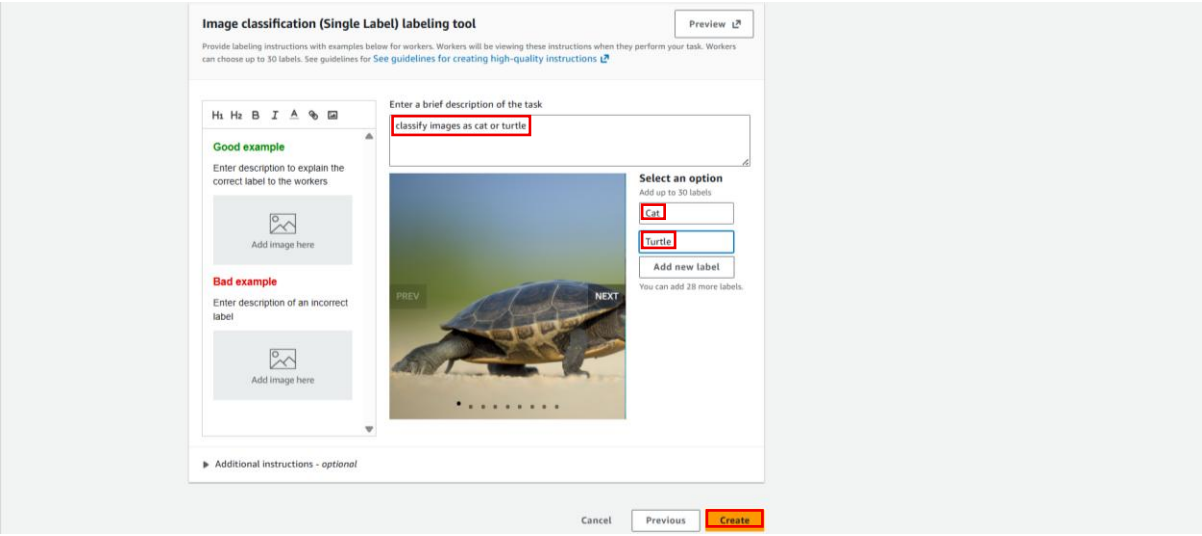
- Now we have to give the Permission of S3 bucket to this role.
- Go to IAM Role
- Give S3FullAccess Permission



- Choose task:
- Image Classification (Single Label)

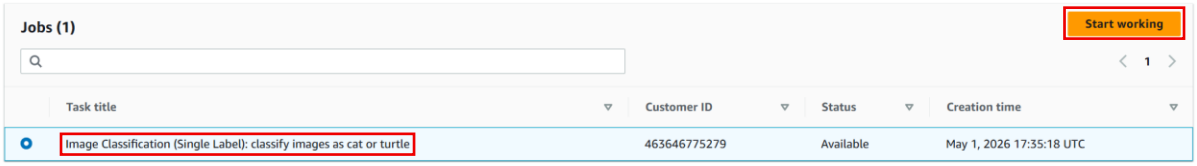


- Define the task (e.g., classify images as cat or turtle) and write clear instructions specifying what to label and the available options.
- Create and launch the labelling job in the system

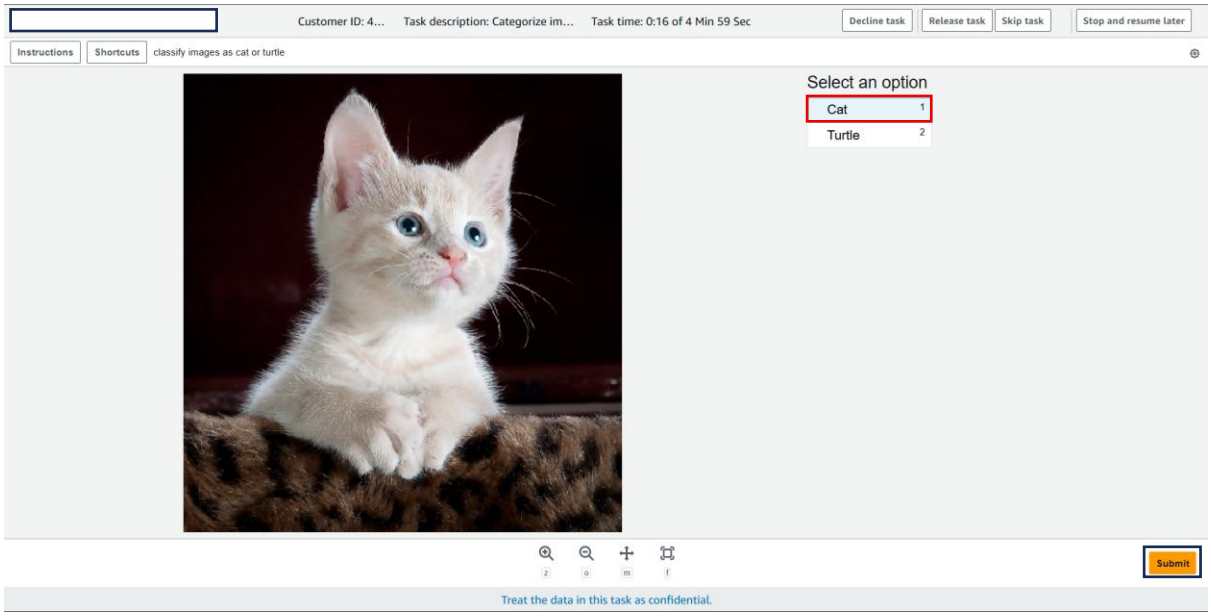


- its status will switch to “in progress” once active.

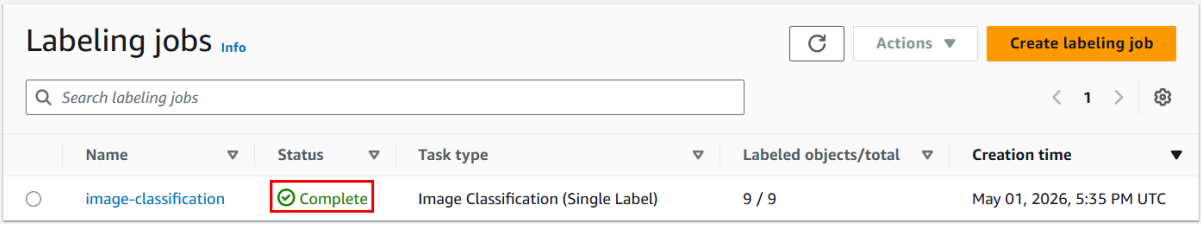
- Open worker portal.
- Select Task
- Click Start Working



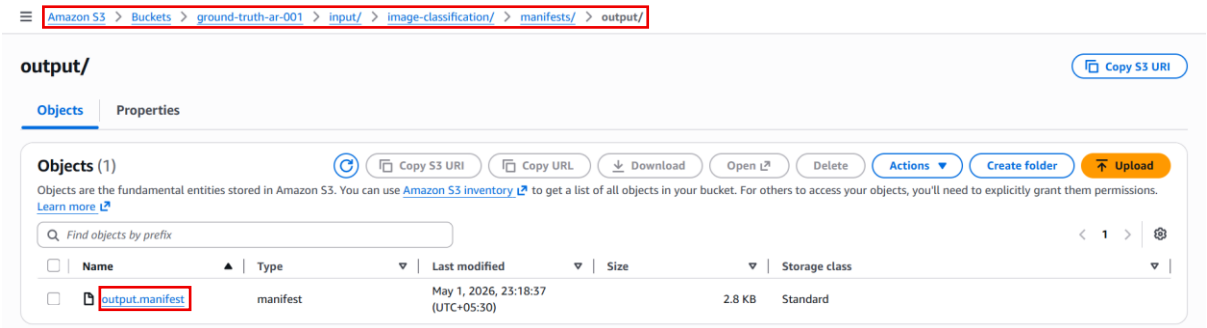
- Label images:
- Select correct label for each image
- Submit each task



- It shows Complete when you labelled all the data



- Open Amazon S3 → output folder.
- Locate:
- Labeled images metadata
- Output manifest file
- Download and inspect manifest:
- Contains image paths + labels



- Use output manifest for:
- Model training (classification models)
- ML pipelines in SageMaker
